Apple

iMessage is an instant messaging service between Apple devices. Synchronize all your products and use it to send attachments, messages, photos, videos and much more. With in-app storage so you don't miss a thing, it's free and has plenty of upgradeable features

Released in 2011, **iMessage** is Apple's application for instant messaging. Based on having an Internet connection, either by mobile data or it can also be through a Wi-Fi connection, it is the improved version of the classic SMS and MMS.

It is a service used by the owners of an **iPhone** or other product of the apple brand to send instant messages through mobile phones or tablets. Messaging has been the main form of communication for a long time, in order to satisfy the needs of its customers, Apple has tried not to disappoint its customers by providing this wonderful form of communication.

The first thing to keep in mind is that **iMessage** doesn't offer anything new that other messaging apps don't already offer, but do you remember the time when to send one from your phone you had to write all those letters? Now we don't even need to write letter by letter unless you feel comfortable. Send audios and even language translation, also so that it is not so simple you can add a sticker or an image.

iMessage is an app like WhatsApp, the only difference is that it is between users of the Apple brand. Its main function is to send messages over the Internet, but improved. To use it, it is as easy as entering your Apple ID and your password, which will allow synchronization with all your brand devices. **Download** iMessage for **free** from the **App Store**.

Its use is very easy, you look for the person you want to write to and simply do it, **iMessage** uses a color coding so that you are clear that what you are sending from the app and not a normal text one. The former will appear in blue, while the latter will appear in green, while those sent to Android devices will be colored in other colors.

You can first send different messages by adding animation to the presentation. Apple really pays a lot of attention to design, and this is one of its strengths. It effectively presents a clean design, very easy and intuitive for users to use. If you want to draw something, there is also an interactive function directly from the **iMessage** panel, of course, draw on photos or make them more spectacular with effects and filters.

Most people really like gifs, so here you can also send them to your friends, as well as share videos and photos that you have captured with your camera or from the app itself. Simply share instantly without wasting time on other platforms. Of course, **iMessage** is compatible with other platforms and applications that you have on your device, share the music you like through **Pandora**, just select from the Share music app. You also have the possibility to share **YouTube** videos or programs with your friends or recommend a movie with **IMDb** or a new movie star that interests you, and of course, you have shared location and routes: this is something very practical through the maps of **Google**.

Remember that you can add and remove anything you want from **iMessage**, without leaving a trace. In case you want it to be more interactive, you can download different sticker packs, which is a matter of personal choice. Stickers sometimes express what is difficult to describe in words, iMessage has an impressive catalog from which to choose and save your favorites.

For **iMessage**, the privacy of its users is very important, for this it has end-to-end encryption that ensures that everything that is sent cannot be seen by anyone else, including Apple.

To organize your information, we can mention that everything received will be stored by the application, unless you decide to delete it, for which you have to configure it. All your photo files and videos can stay with you and move them to any other device you have. For those who have not had Apple products, we will mention that there is a natural symbiosis between all their products. These devices have a connection between them through which they communicate for free over the Internet without being charged by their mobile plan.
